Dacite of Medicine Lake Glass Flow (dm)												
Southeast - CS	4B306	41.596°	238.410°	16/16	Th	62.7°	347.5°	3.6°	105	15.85773	80.2°	171.8°
West side – PB	5B370	41.601°	238.393°	(No evidence of stable PTRM from prismatic jointed blocks)								

Notes: Unit name and symbol from Donnelly-Nolan (2010); individual sites are listed with geographic descriptor and code for nature of outcrop sampled: WT – welded tephra, LF – lava flow outcrop, PB – prismatic blocks, CS – crease structure; Site – alphanumeric identifier; Latitude and Longitude – site location in latitude degrees (N), and longitude degrees (E); N/No – the number of cores used compared to the number originally taken at the site; Exp. – the strength of the peak alternating field (AF) demagnetization field in mT; a plus (+) sign indicates that higher value AF steps were also used, Th indicates thermal demagnetization of the site, Pl – indicates that a planes analysis was used, and NRM indicates that no site-wide demagnetization was conducted after test samples showed no secondary components of magnetism were evident in the samples; I – remanent inclination in degrees; D – remanent declination in degrees;  $\alpha_{95}$  – radius of the 95% confidence limit about the mean direction; k – estimate of the Fisher precision parameter; R – length of the resultant vector; Plat. and Plong. – location in degrees north and east of the virtual geomagnetic pole (VGP) calculated from the mean direction of the site. Mean unit values are in bold. I and D values in parentheses were not used in determining unit mean values. Data collected 1974 through 1998 by D.E. Champion.
